**Patient: GOPIE, CINDY**  
**Date of Birth: 08-16-1980**  
**Phone: (917) 755-9007**  
**MRN: 507154ZPR Acc: 1022148181**  
**Date of Exam: 03-07-2022**

**EXAM: MRI RIGHT KNEE WITHOUT CONTRAST**

**HISTORY:** Status post motor vehicle accident with right knee pain.

**TECHNIQUE:** Multiplane, multisequence MRI of the right knee was performed utilizing standard protocol.

**COMPARISON:** None available.

**FINDINGS:**

**Menisci:** The medial and lateral menisci are normal in size and signal intensity, without evidence of tear.

**Ligaments:** The cruciate and collateral ligaments are intact.

**Articular cartilage:** There is high-grade chondral fissuring and delamination over the median ridge of the patella associated with subchondral signal change and edema. There is mild abnormal signal and irregularity of the cartilage along the lateral facet of the femoral trochlea. There is flattening of the femoral trochlear sulcus.

**Osseous:** There is mild lateral shift of the patella. There is no acute fracture or focal bone marrow signal abnormality.

**Synovium:** There is a small joint effusion. There is no significant popliteal cyst. There is no visible loose body.

**Muscle/tendons:** The extensor mechanism is unremarkable. The iliotibial band, biceps femoris, and popliteus tendons are intact. The para-articular musculature is unremarkable.

**Superficial soft tissues:** There is patchy prepatellar subcutaneous soft tissue edema and/or fibrosis. There is no focal fluid collection.

**IMPRESSION:**

1. High-grade chondral fissuring and delamination over the median ridge of the patella with subchondral cystic change/edema. Mild lateral facet femoral trochlear chondral degeneration. Femoral trochlear dysplasia and lateral patellar shift.
2. No meniscal or ligament tear or occult osseous injury identified.
3. Small joint effusion.
