MRI OF THE RIGHT SHOULDER

CLINICAL HISTORY: Right shoulder pain.

TECHNIQUE: Multiplanar and multisequential MRI of the right shoulder was obtained.

FINDINGS: The acromioclavicular joint is unremarkable. There is type II acromion. There is subchondral cyst noted involving the humeral head.

There is thickening and tendinopathy of the supraspinatus tendon. The infraspinatus, subscapularis, and teres minor tendons are unremarkable.

There is no displaced labral tear. There is no paralabral cyst. The long and short heads of the biceps tendon are intact. The biceps anchor is unremarkable. There is no Hills-Sachs lesion. There is no joint effusion. There is no soft tissue mass.

There is fluid noted within the subcoracoid bursa, compatible with subcoracoid bursitis.

IMPRESSION:
