MAGNETIC RESONANCE IMAGING OF THE LEFT HAND

TECHNIQUE: Multiplanar, multisequential MRI was performed in the neutral sitting position.

HISTORY: Patient complains of left hand pain with numbness and tingling. Status post MVA 6/23/22.

INTERPRETATION: The examination was performed with the wrist in ulnar deviation.

Marrow spaces are unremarkable, from the level of the carpometacarpal joints distally, other than a punctate bony erosion in the third metacarpal head. Joint spaces are preserved. The articular cartilage is maintained. Collateral ligaments are intact. Flexor and extensor digitorum tendon complexes are preserved. No pulley system abnormality is seen. Visualized intrinsic hand musculature is unremarkable.

IMPRESSION:

- No appreciable osseous or soft tissue abnormality within the left hand.

Thank you for referring your patient to us for evaluation.

Sincerely,

David R. Payne, MD
