MRI OF THE LEFT SHOULDER

CLINICAL HISTORY: Left shoulder pain.

TECHNIQUE: Multiplanar and multisequential MRI of the left shoulder was obtained.

FINDINGS: There are hypertrophic changes of the acromioclavicular joint. There is type III acromion. There is os acromiale.

There is thickening and tendinopathy/tendinitis of the supraspinatus tendon with focus of partial articular surface tear about its insertion site to the greater tuberosity. The infraspinatus, subscapularis and teres minor tendons are unremarkable.

There is no displaced labral tear. There is no paralabral cyst. The long and short heads of the biceps tendon are intact. The biceps anchor is unremarkable. There is no Hills-Sachs lesion. There is no joint effusion. There is no soft tissue mass.

IMPRESSION:

1. Os acromiale.
