Patient: GOPIE, CINDY
Date of Birth: 08-16-1980
Phone: (917) 755-9007
MRN: 507154ZPR **Acc:** 1022148182
Date of Exam: 03-07-2022

EXAM: MRI LEFT KNEE WITHOUT CONTRAST

HISTORY: Status post motor vehicle accident with left knee pain.

TECHNIQUE: Multiplane, multisequence MRI of the left knee was performed utilizing standard protocol.

COMPARISON: None available.

FINDINGS:

Menisci: The medial and lateral menisci are normal in size and signal intensity, without evidence of tear.

Ligaments: The cruciate and collateral ligaments are intact.

Articular cartilage: There is mild abnormal signal and irregularity of the cartilage along the posterior aspect of the lateral tibial plateau. There is minimal high-grade chondral fissuring along the median ridge and medial facet of the patella associated with mild subchondral cystic change. There is flattening of the femoral trochlear sulcus.

Osseous: There is no acute fracture or focal bone marrow signal abnormality.

Synovium: There is minimal joint effusion along with a miniscule popliteal cyst. There is a small loculation of joint fluid in the popliteus tendon sheath. There is no visible loose body.

Muscle/tendons: The extensor mechanism is unremarkable. The iliotibial band, biceps femoris, and popliteus tendons are intact. The para-articular musculature is unremarkable.

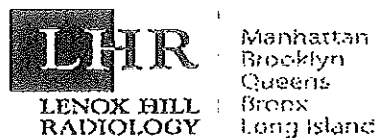

Superficial soft tissues: There is mild prepatellar cutaneous soft tissue edema and/or fibrosis. There is no focal fluid collection.

IMPRESSION:

1. Minimal high-grade chondral fissuring over the median ridge and medial facet of the patella with subchondral cystic change. Dysplastic femoral trochlea noted.
2. Mild lateral tibial plateau chondral degeneration.
3. No meniscal or ligament tear or occult osseous injury identified.
4. Minimal joint effusion.
