MAGNETIC RESONANCE IMAGING OF THE RIGHT HAND

TECHNIQUE: Multiplanar, multisequential MRI was performed in the neutral sitting position.

HISTORY: Patient complains of right hand pain with numbness and tingling status-post MVA 06/23/22.

INTERPRETATION: Marrow spaces are unremarkable, from the level of the carpometacarpal joints distally. Note is made of a 0.3 cm bony erosion at the medial aspect of the proximal pole of the trapezoid. Articular cartilage are preserved. Collateral ligaments are intact. Flexor and extensor digitorum tendon complexes are preserved. No pulley system abnormality is seen. Visualized intrinsic hand musculature is unremarkable.

IMPRESSION:

- No appreciable acute or significant chronic osseous or soft tissue pathology within the right hand.

Thank you for referring your patient to us for evaluation.

Sincerely,

David R. Payne, MD
Diplomate of the American Board of Radiology with Added Qualifications in Neuroradiology
