<b>CLINICAL HISTORY</b>	PAIN DUE TO ACCIDENT	<b>GENDER</b>	M

#### MRI OF THE RIGHT SHOULDER

**CLINICAL HISTORY:** Right shoulder pain, accident.

**TECHNIQUE:** Multiplanar and multisequential MRI of the right shoulder was obtained.

**FINDINGS:** There is normal signal of the marrow. There is no fracture line. There are hypertrophic changes of the acromioclavicular joint with resorption of distal acromion and clavicle.

There is thickening and tendinopathy/tendinitis of the supraspinatus tendon. The infraspinatus, subscapularis, and teres minor tendons are unremarkable.

There is no displaced labral tear. There is no paralabral cyst. The long and short heads of the biceps tendon are intact. The biceps anchor is unremarkable. There is no Hills-Sachs lesion. There is no joint effusion. There is no soft tissue mass.

**IMPRESSION:**
