<b>STUDY DESCRIPTION:</b>	MRI SHOULDER WITHOUT CONTRAST	<b>MRN:</b>	MORC53631
<b>DOB:</b>	08/12/1973	<b>REFERRING PHYSICIAN:</b>	Smith, Tara
<b>CLINICAL HISTORY</b>	C/O RT SHOULDER PAIN DUE TO MVA BEST IMAGES POSSIBLE PATIENT WAS MOVING DURING THE TEST	<b>GENDER</b>	M

#### MRI OF THE RIGHT SHOULDER

**CLINICAL HISTORY:** Right shoulder pain.

**TECHNIQUE:** Multiplanar and multisequential MRI of the right shoulder was obtained.

**FINDINGS:** Study is limited due to magnet. There are hypertrophic changes of the acromioclavicular joint.

The rotator cuff tendons are poorly evaluated due to so much artifact. There appears to be thickening of supraspinatus tendon, suspicious for tendinopathy.

The glenoid labrum cannot be evaluated. The long and short heads of the biceps tendon cannot be fully evaluated. Superior glenoid labrum appears to be intact. The biceps anchor appears to be intact. There is no Hills-Sachs lesion. There is no joint effusion.

#### IMPRESSION:

1. Very limited examination.
2. Impingement morphology.
3. Suspicious of tendinopathy of anterior leading fibers of supraspinatus tendon.
